<u>DAY 5 – TESTING AND BACKEND</u> <u>REFINEMENT</u>

Functional Testing

Test Core Features:

Product listing:

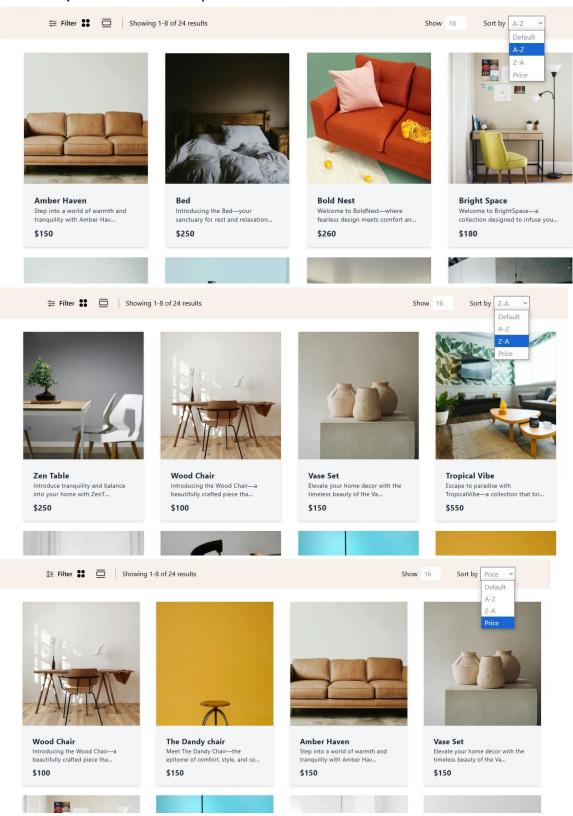

The product listing API is functioning correctly, displaying all products as expected. The response structure is consistent, and all required fields are present, ensuring a smooth user experience.

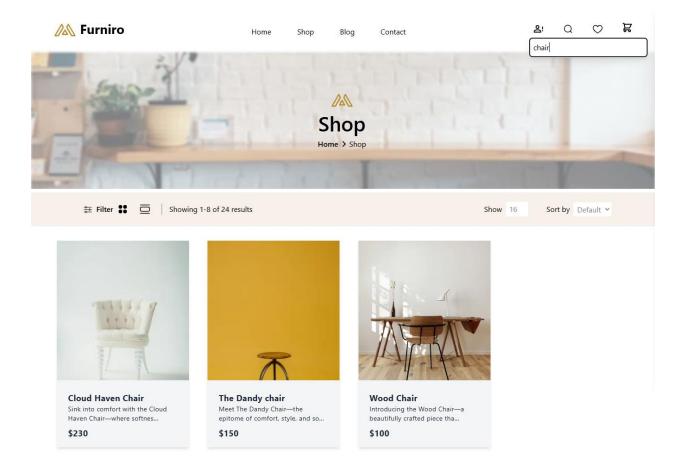

Filters and search:

The filtering and sorting functionality in the application is working correctly. Products are accurately displayed based on user-selected criteria, such as A-Z, Z-A, and price (low to high). The search feature returns relevant results, ensuring users

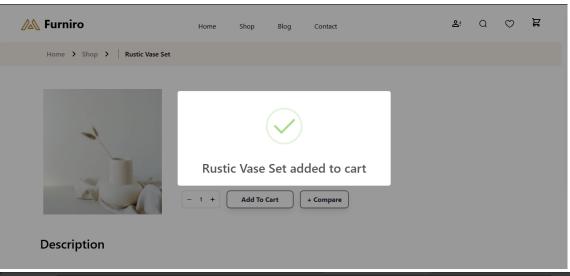

can easily find the desired products.

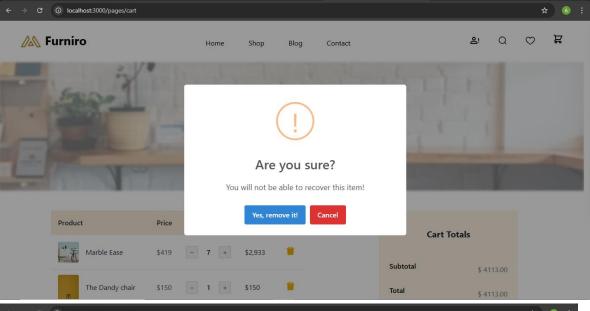

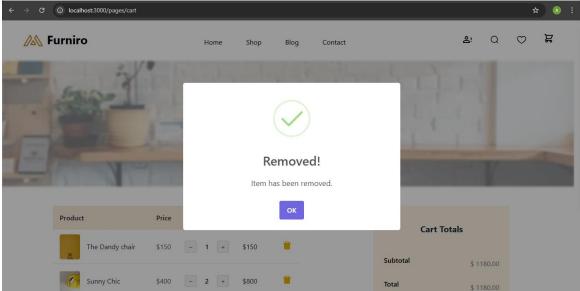

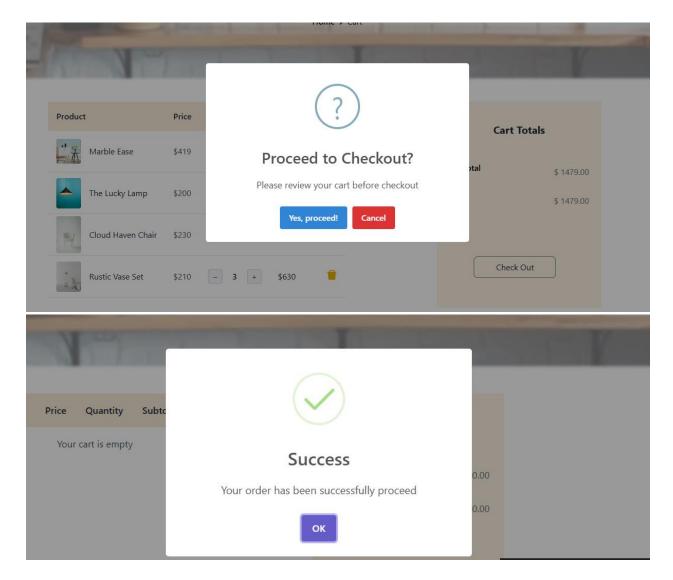

Cart Options:

The cart operations are working smoothly, allowing users to **add, update, and remove** items seamlessly. When a product is added, updated, or removed, a **Sweet Alert** success message is displayed, enhancing the user experience. This ensures users receive instant feedback on their actions.

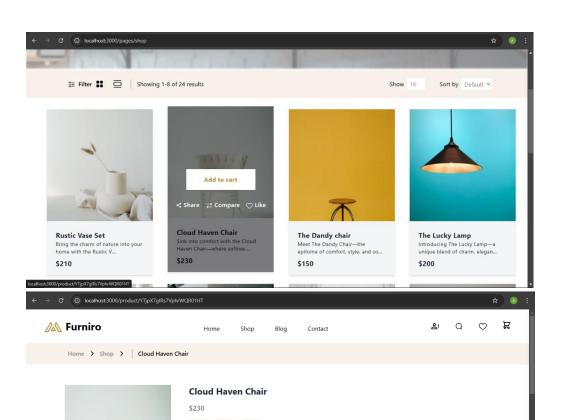

Dynamic Routing:

The dynamic routing is working correctly, ensuring that individual product detail pages load as expected. Each product page displays the correct information, including the product name, price, description, and images. This provides a smooth user experience.

How to Perform Functional Testing:

1. Write Test Cases for Each Feature

Each feature should have test cases that define the expected input and output.

These are some examples of each feature

Test	Test Case	Test Steps	Expected	Actual	Status	Severity	Assigned	Remarks
Case	Description		Result	Result		Level	То	
ID								
TC00	Validate	Open	Products	Products	Passed	High	-	No
1	product	product	displayed	displayed				issues
	listing page	page >	correctly	correctly				found
		Verify						
		products						
TC00	Test API	Disconnec	Show	Error	Passed	Medium	-	Handled
2	error	t API >	fallback UI	message				gracefull
	handling	Refresh	with error	shown				У
		page	message					

TC00	Check cart	Add	Cart	Cart	Passed	High	-	Works as
3	functionalit	product to	updates	updates				expected
	у	cart >	with	as				
		Verify cart	added	expected				
		contents	product					
TC00	Ensure	Resize	Layout	Responsiv	Passed	Medium	_	Test
4	responsive	browser	adjusts	e layout	rassea	Wicaraiii		successf
	ness on	window >	properly	working				ul
	mobile	Check	to screen	as				
		layout	size	intended				

2. Simulate User Actions

To ensure the API behaves as expected under real-world scenarios, user actions were simulated using Thunder Client. The following actions were tested:

- **API Request Execution:** Sending requests to various endpoints to validate responses.
- **Response Validation:** Checking status codes, response body structure, and data integrity.
- **Performance Metrics:** Measuring response time and payload size for optimization.

API Response Check:

• API Endpoint: [https://template6-six.vercel.app/api/products]

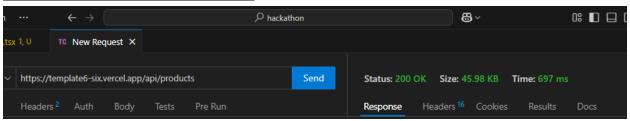

• HTTP Method: [GET]

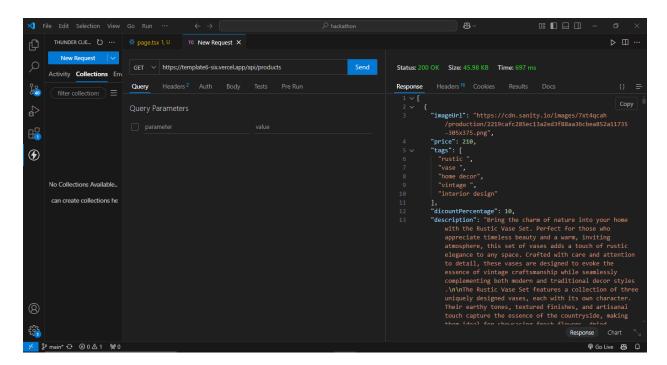

• Response Status: 200 OK

• Response Size: 45.98 KB

• Response Time: 697 ms

Screenshot of API Response:

This validation confirms that the API handles user interactions correctly, ensuring smooth functionality across the system.

3. Validate Output Against Expected Results

Compare the actual behavior of the application with the expected results.

- **Expected behavior:** Product gets added, checkout is successful, or search returns results.
- If output deviates: Error messages like "No products found" or "Cart is empty" should appear.

Error Handling

Add Error Messages:

By using try-catch blocks to handle API errors.

```
File Edit Selection View Go Run

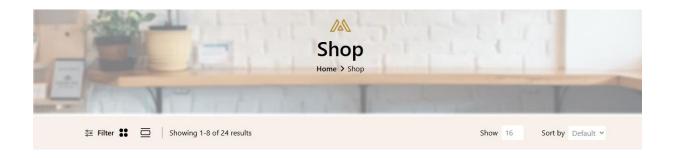

∠ hackathon

                         JS importData.js U X
      TC New Request
       script > JS importData.js > 😭 importProducts
              async function importProducts() {
                try {
                  const response = await fetch('https://template6-six.vercel.app/api/products');
                  if (!response.ok) {
                    throw new Error(`HTTP error! Status: ${response.status}`);
<del>L</del>
                  const products = await response.json();
for (const product of products) {
                    await uploadProduct(product);
                } catch (error) {
                  console.error('Error fetching products:', error);
              importProducts();
```

Fallback UI:

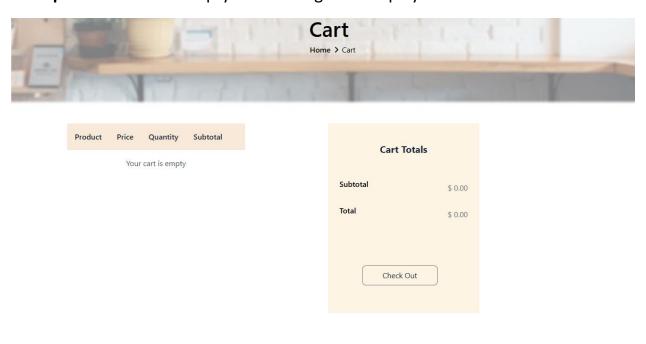

Display alternative content when data is unavailable.

Example: when products are unavailable this message will display.

Example: when cart is empty this message will display.

Performance Optimization

Optimization Steps:

Optimize Images: Use WebP format via Sanity Image API for faster loading. **Lazy Load Products:** Implement pagination to improve performance.

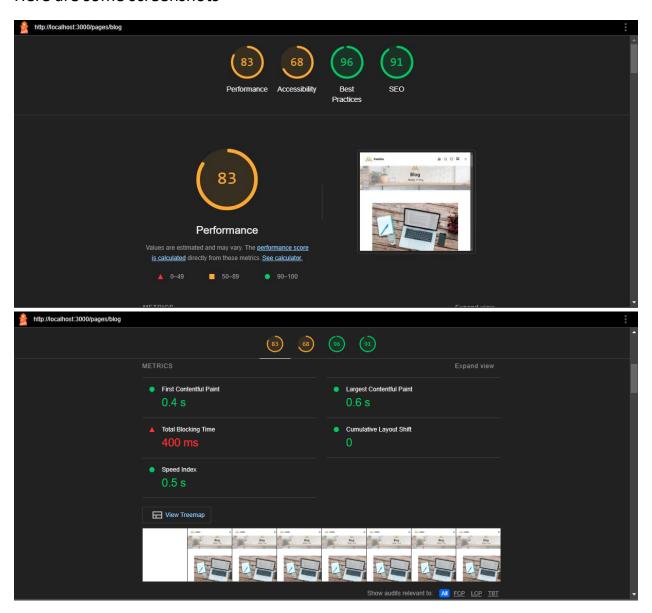

Use Efficient Queries: Fetch only necessary product data to minimize response time. **Set Image Priority:** Use priority in **Next.js <Image>** for critical images to improve loading speed.

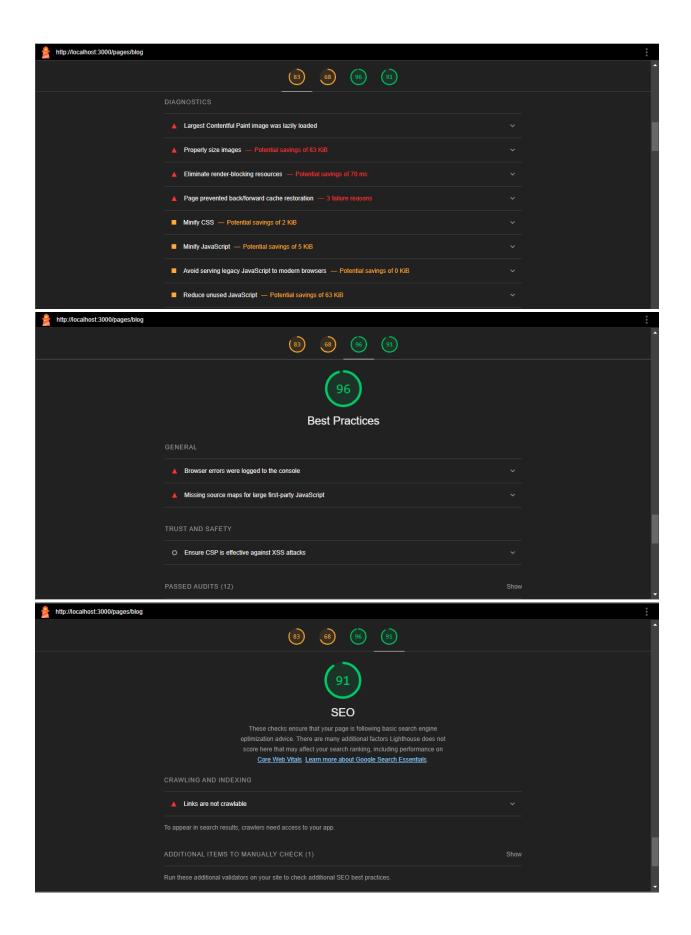

Leverage CDN: Use Sanity's built-in **CDN** to optimize image delivery and reduce load times.

Analyze Performance:

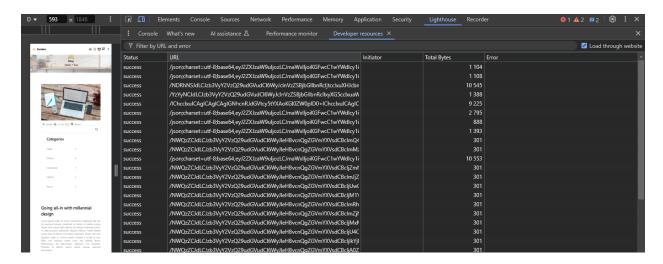

Use Lighthouse to identify speed and performance issues.

Testing Tools Used:

Manual Testing: Test across all screen sizes (mobile, tablet, desktop) for functionality such as filtering, search, add to cart, and success messages.

Lighthouse: To test performance, accessibility, best practices, and SEO across all screen sizes. It helps identify areas for improvement, such as optimizing images, reducing TBT, and enhancing user experience.
